

Imaging of the Canine Head - Resident Course

In this presentation, imaging of the canine head, focussing on nasal, oral, dental, masticatory, aural, salivary and lymph node structures, will be covered. Pros and cons of different imaging modalities including radiography, ultrasound, CT and MRI will be discussed. Imaging features will be put into context with typical clinical features of head diseases in dogs.

Workshop: Empathy-Focussed Radiology Reporting

The most important skill of a radiologist in the very near future, will be to put imaging findings into context with the patient history and clinical signs and to listen to and communicate with the referring veterinarian effectively. In other words, to fine tune our emotional intelligence. In this workshop Tobias will explore with practical exercises how we can structure a report to make it factually accurate, meaningful, and rewarding to your customer at the same time. This is a writing exercise, please bring your laptop if you prefer this for writing.
